

IoT Common Security Requirements  
Guidelines 2019:  
CCDS-GR01-2019  
Ver. 2.0

General Incorporated Association  
Connected Consumer Device Security Council  
February 26, 2020

## Update History

Revision	Date of Update	Description of Update	Formulated by
Draft	2018/11/26	New Release	CCDS
Draft2	2019/3/8	Correction of points in the Common Requirements Review WG	CCDS
Rev. 1.0	2019/4/11	Rev. 1.0 release	CCDS
Rev. 2.0	2020/2/26	Rev. 2.0 release	CCDS

■ Notice

- Information in this document is that available at the time of publication of this document and is subject to change without notice.
- Duplication or reproduction of the contents of this document without prior permission from the CCDS is strictly prohibited.

## 1. Purpose of This Document

This Guidelines defines a minimum set of requirements (action level: ★) to be fulfilled by connected devices. These minimum requirements are to apply to IoT device and system implementations of connected devices.

## 2. Scope of Granting of the CCDS Certification Mark

The scope of granting of the CCDS Certification Mark encompasses those device and system implementations of Internet Protocol-ready hardware and software interfaces.

## 3. Common Requirements

The table below summarizes the common individual requirements.

No.	Target Level	Certification Requirement	Kind of Vulnerability	Explanation (Background of the threat and example)
1	★ (Common)	There must not be Web input-based SQL injection defects.	CWE-89: SQL injection	<p>[Background of the threat]</p> <p>An inadequately invalidated SQL syntax contained in user input could override security checks or allow statements to be inserted, a backend database to be tampered or system commands to be executed. (CWE-TOP6)</p> <p>[Examples]</p> <ul style="list-style-type: none"> <li>• Wi-Fi wireless router, (CVE-2015-6319)</li> </ul> <p>[Remarks]</p> <ul style="list-style-type: none"> <li>• Requirements defined in “UK Code of Practice for consumer IoT security”</li> </ul> <p>13. Validate input data</p>
2	★ (Common)	There must not be Web input-based cross-site request forgery defects.	CWE-352: Cross-site request forgeries	<p>[Background of the threat]</p> <p>A vulnerability that arises as a result of failure to verify that user requests are properly formatted. Attackers could fool clients, causing them to transmit unintended requests to a Web server. (CWE-TOP7)</p>

				<p>[Examples]</p> <ul style="list-style-type: none"> <li>• Wi-Fi wireless router (CVE-2014-7270)</li> </ul> <p>[Remarks]</p> <ul style="list-style-type: none"> <li>• Requirements defined in “UK Code of Practice for consumer IoT security”</li> </ul> <p>13. Validate input data</p>
3	★ (Common)	There must not be Web input-based path traversal defects.	CWE-22: Path traversal	<p>[Background of the threat]</p> <p>The vulnerability of allowing access to a restricted directory by creating a pathname from external input. (CWE-TOP11)</p> <p>[Examples]</p> <ul style="list-style-type: none"> <li>• IP camera (CVE-2017-7461)</li> </ul> <p>[Remarks]</p> <ul style="list-style-type: none"> <li>• Requirements defined in “UK Code of Practice for consumer IoT security”</li> </ul> <p>13. Validate input data</p>
4	★ (Common)	TCP/UDP ports out of service must not be left open for use from outside.	CWE-671: Lack of administrator control over security (unnecessary TCP/UDP ports left open)	<p>[Background of the threat]</p> <p>If TCP/UDP ports that are not needed for functional or service purposes are left open, they could open a way communication that might be abused by cyber attackers.</p> <p>[Examples]</p> <ul style="list-style-type: none"> <li>• Wi-Fi wireless routers, IP cameras and more</li> </ul> <p>[Remarks]</p> <ul style="list-style-type: none"> <li>• Requirements defined in “UK Code of Practice for consumer IoT security”</li> </ul> <p>6. Minimize exposed attack surfaces</p>
5	★ (Common)	TCP / UDP ports required for system operation must be managed by an appropriate	CWE-287: Inappropriate certification practices (inappropriate access	<p>[Background of the threat]</p> <p>Appropriate access control is not implemented for the open TCP / UDP port, threatening problems such as information leaks from the data stored in the devices or privilege elevation (seizure</p>

		access authentication method (unique ID and password for each device, or managed ID and password that should not be disclosed to the outside).	management of TCP/UDP ports)	of control over the management functions) can occur. [Examples] • Wi-Fi wireless routers, IP cameras and more [Remarks] • Requirements defined in “UK Code of Practice for consumer IoT security” 6. Minimize exposed attack surfaces
6	★ (Common)	<ul style="list-style-type: none"> <li>• Certification information must be capable of being re-edited</li> <li>• When using for the first time, it has a function to prompt to change the settings.</li> <li>• The ID and password should not be hard-coded (the initial password can be the same).</li> </ul>	CWE-259: Problems associated with a hard-coded password (such as an inappropriately implemented or hard-coded access code or unmodifiable access code).	<p>[Background of the threat]</p> <p>If certification information used to access a device or application, such as ID or password information, is endangered when it is hard-coded or the implementation prohibits its modification, there would be no way responding to it, leading to vulnerabilities.</p> <p>[Examples]</p> <ul style="list-style-type: none"> <li>• Medical institution systems</li> </ul> <p>[Remarks]</p> <ul style="list-style-type: none"> <li>• Requirements defined in “Certification of Compliance of Devices with the Relevant Security Standards”</li> <li>• Requirements defined in the “California State Laws”</li> <li>• Requirements defined in “UK Code of Practice for consumer IoT security”</li> </ul> <p>1. No Default Password (Certification information must be set before any default password can be used.)</p>
7	★ (Common)	<ul style="list-style-type: none"> <li>• Functions must be in place that permit uses to</li> </ul>	Inadequate implementation of functions	<p>[Background of the threat]</p> <p>If a function that permits deleting security settings, confidential</p>

		easily delete information defined or collected by them while using a device. <ul style="list-style-type: none"> <li>Updated system software must be capable of being maintained even after such information has been deleted.</li> </ul>	allowing for scrapping or reuse. <ul style="list-style-type: none"> <li>No applicable CWE</li> </ul>	information, privacy information and other information retained by devices or applications is not implemented, such information could leak out upon scrapping or reuse. [Examples] <ul style="list-style-type: none"> <li>PCs, USB memory smartphones</li> </ul> [Remarks] <ul style="list-style-type: none"> <li>Requirements defined in the “UK Code of Practice for consumer IoT security”</li> </ul> 8. Ensure that personal data is protected 11. Make it easy for consumers to delete personal data
8	★ (Common)	The latest scheme of certification recommended by the Wi-Fi Alliance must be supported.	CWE-326: Problems of the absence of an encryption scheme having a strength (latest Wi-Fi communication encryption function not implemented).	[Background of the threat] The scheme of communication encryption used in the Wi-Fi devices is not the latest one but it employs vulnerable encryption protocol or encryption algorithm. [Examples] <ul style="list-style-type: none"> <li>Wi-Fi wireless router</li> </ul> [Remarks] <ul style="list-style-type: none"> <li>Requirements covered din the “UK Code of Practice for consumer IoT security”</li> </ul> 5. Communicate securely
9	★ (Common)	The latest pairing scheme recommended by the Bluetooth SIG must be supported.	CWE-287: Inappropriate authentication (Bluetooth pairing function not implemented).	[Background of the threat] Specifications earlier than Bluetooth 2.0+EDR would require the devices to be paired with each other to enter a numeric sequence, called a “PIN code.” Typically, implementations involving the entry of a four-digit, such as 0000 are so common that they could be attacked by entering pre-planned sequences, compromising security easily. [Examples]

				<ul style="list-style-type: none"> <li>• Devices adhering to specifications earlier than s Bluetooth 2.0+EDR</li> </ul> <p>[Remarks]</p> <ul style="list-style-type: none"> <li>• Requirements defined in the “UK Code of Practice for consumer IoT security”</li> </ul> <p>5. Communicate securely</p>
10	★ (Common)	Unnecessary device classes must be made non-recognizable for system operation purposes.	Use of device classes that do no require USB <ul style="list-style-type: none"> <li>• No applicable CWE</li> </ul>	<p>[Background of the threat]</p> <p>The implementation of unnecessary device classes could open a way for attacks being launched via malware, for example.</p> <p>[Examples]</p> <ul style="list-style-type: none"> <li>• USB-mounted devices in general</li> </ul> <p>[Remarks]</p> <ul style="list-style-type: none"> <li>• Requirements defined in “UK Code of Practice for consumer IoT security”</li> </ul> <p>6. Minimize exposed attack surfaces</p>
11	★ (Common)	<ul style="list-style-type: none"> <li>• Software update must be possible.</li> <li>• The state of software having been updated must be maintained even after the power is turned off.</li> </ul>	Software update function not implemented <ul style="list-style-type: none"> <li>• No applicable CWE</li> </ul>	<p>[Background of the threat]</p> <p>If a function that permits updating software or firmware upon detection of vulnerabilities in them is not implemented, they could be exposed to attacks taking advantage of their security holes.</p> <p>[Examples]</p> <ul style="list-style-type: none"> <li>• Wi-Fi wireless routers, IP cameras and more</li> </ul> <p>[Remarks]</p> <ul style="list-style-type: none"> <li>• Requirements defined in “Certification of Compliance of Devices with the Relevant Security Standards”</li> <li>• Requirements defined the “UK Code of Practice for consumer IoT security”</li> </ul> <p>3. Keep software updated</p> <p>9. Make systems resilient to outages</p>
12	★	1) A contact for	• No applicable	[Background]

	(Common)	<p>information on product vulnerabilities must be available and made public.</p> <p>2) A product security update support site must be available.</p>	CWE	<p>Security standards in effect in and outside Japan targeting IoT devices define an organizational plan or operational scheme for product providers.</p> <p>[Remarks]</p> <p>Requirements defined in NISTIR 8259 “Foundational Cybersecurity Activities for IoT Device Manufactures”</p> <p>Activity 6: Decide what to communicate to customers and how to communicate it.</p>
